# Abelian Categories

- Introduced by Grothedieck in 1950s to unify homological algebra
- Associate abelian group type object to spaces via co-chain complexes:

$$\cdots C^{i-1}(X) \xrightarrow{d^{i-1}} C^i(X) \xrightarrow{d^i} C^{i+1}(X) \cdots,$$

where  $d^i \circ d^{i-1} = 0$ .

# Abelian Categories

- Introduced by Grothedieck in 1950s to unify homological algebra
- Associate abelian group type object to spaces via co-chain complexes:

$$\cdots C^{i-1}(X) \xrightarrow{d^{i-1}} C^i(X) \xrightarrow{d^i} C^{i+1}(X) \cdots,$$

where  $d^i \circ d^{i-1} = 0$ .

Ab Cats

• The cohomology is then  $H^i(X) = \frac{\ker d^i}{\operatorname{Im} d^{i-1}}$ , measures how inexact the complex is.

- Introduced by Grothedieck in 1950s to unify homological algebra
- Associate abelian group type object to spaces via co-chain complexes:

$$\cdots C^{i-1}(X) \xrightarrow{d^{i-1}} C^i(X) \xrightarrow{d^i} C^{i+1}(X) \cdots,$$

where  $d^i \circ d^{i-1} = 0$ .

Ab Cats

- The cohomology is then  $H^{i}(X) = \frac{\ker d^{i}}{\operatorname{Im} d^{i-1}}$ , measures how inexact the complex is.
- This process is functorial.

# Definition

# An abelian category is a category $\underline{A}$ satisfying (1) $\underline{A}$ is additive:

# Definition

An abelian category is a category  $\underline{A}$  satisfying

(1)  $\underline{A}$  is additive: each set of morphisms is an abelian group (and composition is bilinear), there is a biproduct and a zero object.

# Definition

An abelian category is a category  $\underline{A}$  satisfying

- (1)  $\underline{A}$  is additive: each set of morphisms is an abelian group (and composition is bilinear), there is a biproduct and a zero object.
- (2)  $\underline{A}$  has all equalisers and all monics are equalisers, and dually.

# Definition

An abelian category is a category  $\underline{A}$  satisfying

- (1)  $\underline{A}$  is additive: each set of morphisms is an abelian group (and composition is bilinear), there is a biproduct and a zero object.
- (2)  $\underline{A}$  has all equalisers and all monics are equalisers, and dually.

# Definition

An abelian category is a category  $\underline{A}$  satisfying

- <u>A</u> is additive: each set of morphisms is an abelian group (and composition is bilinear), there is a biproduct and a zero object.
- (2)  $\underline{A}$  has all equalisers and all monics are equalisers, and dually.

Notes

• (2) tells us that all maps have kernels, cokernels and images and that "monic+epic=isom".

# Definition

An abelian category is a category  $\underline{A}$  satisfying

- (1) <u>A</u> is additive: each set of morphisms is an abelian group (and composition is bilinear), there is a biproduct and a zero object.
- (2)  $\underline{A}$  has all equalisers and all monics are equalisers, and dually.

- (2) tells us that all maps have kernels, cokernels and images and that "monic+epic=isom".
- Some conditions are redundant.

# Definition

- <u>AbCat</u> is the (lax 2-)category of abelian categories with exact functors.
- Any abelian category <u>A</u> admits an exact full embedding in <u>Ab</u>.

#### Some constructions in abelian categories

# Some constructions in abelian categories

A pair of composable maps  $f : a \to b$  and  $g : b \to c$  is exact at b if Im(f) = ker(g).

#### eg

$$0 \to \ker f \to a \xrightarrow{f} b \to \operatorname{coker} f \to 0$$

is exact at all places.

# Some constructions in abelian categories

A pair of composable maps  $f : a \to b$  and  $g : b \to c$  is exact at b if Im(f) = ker(g).

#### eg

$$0 \rightarrow \ker f \rightarrow a \xrightarrow{f} b \rightarrow \operatorname{coker} f \rightarrow 0$$

is exact at all places.

We can define cohomology as before and it measures how a complex fails to be exact.

# Some constructions in abelian categories

A pair of composable maps  $f : a \to b$  and  $g : b \to c$  is exact at b if Im(f) = ker(g).

eg

 $0 \to \ker f \to a \xrightarrow{f} b \to \operatorname{coker} f \to 0$ 

is exact at all places.

We can define cohomology as before and it measures how a complex fails to be exact.

Let A, B and C be complexes and suppose  $0 \to A \to B \to C \to 0$ is exact (we say short exact) then there is a canonical map  $H^i(C) \to H^{i+1}(A)$  such that the resulting sequence

 $\cdots \rightarrow H^{i}(A) \rightarrow H^{i}(B) \rightarrow H^{i}(C) \rightarrow H^{i+1}(A) \rightarrow H^{i+1}(B) \rightarrow \cdots$ 

is exact.

- Well developed theory of dimension.
- Schemes come with structure sheaves O<sub>X</sub>. Can consider
  O<sub>X</sub> -mod. Restrict to finitely presented modules: Coh(X).
- <u>Coh(X)</u> is abelian.
- There are cohomology functors  $\underline{\operatorname{Coh}(X)} \to \underline{\operatorname{Ab}}^{\mathbb{N}}$  with  $H^0 = \Gamma$ , the global sections functor.

#### Extracting Geometrical Information

▲ロト ▲圖 ▶ ▲ 画 ▶ ▲ 画 → のへで
#### Example

Let X be a 2 dimensional (projective) variety. A curve on X can be viewed as the zero set of an algebraic map  $s : \mathcal{O}_X \to L$ , where L is a suitable (locally-free) rank 1  $\mathcal{O}_X$ -module.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

#### Example

Let X be a 2 dimensional (projective) variety. A curve on X can be viewed as the zero set of an algebraic map  $s : \mathcal{O}_X \to L$ , where L is a suitable (locally-free) rank 1  $\mathcal{O}_X$ -module.

Given some points  $Y \subset X$ , we can consider the sheaf  $\mathcal{O}_Y$  as an object of  $\underline{Coh}(X)$ .

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

#### Example

Let X be a 2 dimensional (projective) variety. A curve on X can be viewed as the zero set of an algebraic map  $s : \mathcal{O}_X \to L$ , where L is a suitable (locally-free) rank 1  $\mathcal{O}_X$ -module.

Given some points  $Y \subset X$ , we can consider the sheaf  $\mathcal{O}_Y$  as an object of  $\underline{Coh}(X)$ .

Then the restriction map  $L \to \mathcal{O}_Y$  is epic and its kernel K has the property that elements of  $H^0(K)$  which map to s correspond precisely to incidence of Y on our curve.

#### Example

Let X be a 2 dimensional (projective) variety. A curve on X can be viewed as the zero set of an algebraic map  $s : \mathcal{O}_X \to L$ , where L is a suitable (locally-free) rank 1  $\mathcal{O}_X$ -module.

Given some points  $Y \subset X$ , we can consider the sheaf  $\mathcal{O}_Y$  as an object of  $\underline{Coh}(X)$ .

Then the restriction map  $L \to \mathcal{O}_Y$  is epic and its kernel K has the property that elements of  $H^0(K)$  which map to s correspond precisely to incidence of Y on our curve.

Estimating the size of  $H^0(K)$  is then useful to determine incidence properties.

			Invariants		

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

#### Example

Dimension 1 projective varieties can be classified into type according to a non-negative integer called its genus. Loosely, the genus corresponds to the number of holes in the space:

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

#### Example

Dimension 1 projective varieties can be classified into type according to a non-negative integer called its genus. Loosely, the genus corresponds to the number of holes in the space:

More generally, we can find a range of numerical invariants and, more generally, cohomology classes (characteristic classes) which allow us to crudely classify both schemes and sheaves on schemes.

### Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\operatorname{Sch}^{\operatorname{op}}}$  of the form

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

## Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\operatorname{Sch}^{\operatorname{op}}}$  of the form

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

 If such a functor is representable then there is a scheme M and natural isomorphism M ≅ Hom(−, M).

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

#### Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\underline{\operatorname{Sch}}^{\operatorname{op}}}$  of the form

Moduli

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

- If such a functor is representable then there is a scheme M and natural isomorphism M ≅ Hom(−, M).
- This means there is some object E over M such that for all schemes S and E ∈ M(S), there is a map f : S → M such that E = f\*E and M is universal for such objects.

## Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\underline{\operatorname{Sch}}^{\operatorname{op}}}$  of the form

Moduli

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

- If such a functor is representable then there is a scheme M and natural isomorphism M ≅ Hom(−, M).
- This means there is some object E over M such that for all schemes S and E ∈ M(S), there is a map f : S → M such that E = f\*E and M is universal for such objects.
- eg. for a scheme X,

 $\mathcal{M}_{X,c}(S) = \{ \text{coherent sheaves with fixed char class } c \text{ on } S \times X \}.$ 

## Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\underline{\operatorname{Sch}}^{\operatorname{op}}}$  of the form

Moduli

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

- If such a functor is representable then there is a scheme M and natural isomorphism M ≅ Hom(−, M).
- This means there is some object 𝔅 over M such that for all schemes S and E ∈ M(S), there is a map f : S → M such that E = f\*𝔅 and M is universal for such objects.
- eg. for a scheme X,

 $\mathcal{M}_{X,c}(S) = \{ \text{coherent sheaves with fixed char class } c \text{ on } S \times X \}.$ 

• But  $\mathcal{M}_{X,c}$  is not representable.

## Moduli Problems

- Consider an object  ${\mathcal M}$  in  $\underline{\operatorname{Set}}^{\underline{\operatorname{Sch}}^{\operatorname{op}}}$  of the form

Moduli

 $\mathcal{M}(S) = \{ \text{objects over } S \text{ under pullback} \}$ 

- If such a functor is representable then there is a scheme M and natural isomorphism M ≅ Hom(−, M).
- This means there is some object E over M such that for all schemes S and E ∈ M(S), there is a map f : S → M such that E = f\*E and M is universal for such objects.
- eg. for a scheme X,

 $\mathcal{M}_{X,c}(S) = \{ \text{coherent sheaves with fixed char class } c \text{ on } S \times X \}.$ 

- But  $\mathcal{M}_{X,c}$  is not representable.
- Partly fix by tweaking the moduli functor (to make *M* into a sheaf in a suitable subcanonical topology on <u>Sch</u>).

Ab Cats	Alg Geom	Moduli	Derived Cats	Triangulated Cats	And Back A

• The key for AG is the existence of a universal object. This is weaker than asking that  ${\cal M}$  be representable.

Moduli

#### How far away is $\underline{D(A)}$ from being abelian?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

### How far away is $\underline{D(A)}$ from being abelian?

• We certainly don't have all kernels and cokernels.

Ab Cats

- We certainly don't have all kernels and cokernels.
- But given a map  $f : A \to B$  of complexes there is another complex C and a monic map  $B \to C$  and epic map  $C \to A[1]$ , where A[1] means "shift left by 1", given by  $A[1] \oplus B$  and differentials  $\begin{pmatrix} -d_A[1] & 0 \\ f & d_B \end{pmatrix}$ .

- We certainly don't have all kernels and cokernels.
- But given a map  $f : A \to B$  of complexes there is another complex C and a monic map  $B \to C$  and epic map  $C \to A[1]$ , where A[1] means "shift left by 1", given by  $A[1] \oplus B$  and differentials  $\begin{pmatrix} -d_A[1] & 0 \\ f & d_B \end{pmatrix}$ .
- If f is the identity map A → A then (easy exercise) C is homotopic to 0.

- We certainly don't have all kernels and cokernels.
- But given a map  $f : A \to B$  of complexes there is another complex C and a monic map  $B \to C$  and epic map  $C \to A[1]$ , where A[1] means "shift left by 1", given by  $A[1] \oplus B$  and differentials  $\begin{pmatrix} -d_A[1] & 0 \\ f & d_B \end{pmatrix}$ .
- If f is the identity map A → A then (easy exercise) C is homotopic to 0.
- These induce an exact sequence

$$\cdots \rightarrow H^{i}(A) \rightarrow H^{i}(B) \rightarrow H^{i}(C) \rightarrow H^{i+1}(A) \rightarrow \cdots$$

### How far away is $\underline{D(A)}$ from being abelian?

- We certainly don't have all kernels and cokernels.
- But given a map  $f : A \to B$  of complexes there is another complex C and a monic map  $B \to C$  and epic map  $C \to A[1]$ , where A[1] means "shift left by 1", given by  $A[1] \oplus B$  and differentials  $\begin{pmatrix} -d_A[1] & 0 \\ f & d_B \end{pmatrix}$ .
- If f is the identity map A → A then (easy exercise) C is homotopic to 0.
- These induce an exact sequence

$$\cdots \rightarrow H^{i}(A) \rightarrow H^{i}(B) \rightarrow H^{i}(C) \rightarrow H^{i+1}(A) \rightarrow \cdots$$

Applied to the cases A = a and B = b in A ⊂ D(A), C is a twist of coker f ⊕ ker f[1].

- We certainly don't have all kernels and cokernels.
- But given a map  $f : A \to B$  of complexes there is another complex C and a monic map  $B \to C$  and epic map  $C \to A[1]$ , where A[1] means "shift left by 1", given by  $A[1] \oplus B$  and differentials  $\begin{pmatrix} -d_A[1] & 0 \\ f & d_B \end{pmatrix}$ .

### And Back Again

• The special subcategory <u>A</u> of <u>D(A)</u> can be constructed as follows.

- The special subcategory <u>A</u> of <u>D(A)</u> can be constructed as follows.
- Define functors \(\tau\)≤n and \(\tau\)≥n, \(\D(A)\) → \(\D(A)\) by truncating complexes at position n:

$$\cdots \to A^{n-2} \to A^{n-1} \to \ker d^n \to 0 \to \cdots$$
$$\cdots \to 0 \to \operatorname{coker} d^n \to A^{n+1} \to A^{n+2} \to \cdots$$

These have the property that for all objects *a* of  $\underline{D}(\underline{A})$ , there is a canonical distinguished triangle  $\tau_{\leq n}a \rightarrow a \rightarrow \tau_{\geq n+1}a$ .

- The special subcategory <u>A</u> of <u>D(A)</u> can be constructed as follows.
- Define functors \(\tau\)≤n and \(\tau\)≥n, \(\D(A)\) → \(\D(A)\) by truncating complexes at position n:

$$\cdots \to A^{n-2} \to A^{n-1} \to \ker d^n \to 0 \to \cdots$$
$$\cdots \to 0 \to \operatorname{coker} d^n \to A^{n+1} \to A^{n+2} \to \cdots$$

These have the property that for all objects *a* of  $\underline{D}(\underline{A})$ , there is a canonical distinguished triangle  $\tau_{\leq n}a \rightarrow a \rightarrow \tau_{\geq n+1}a$ .

 Then if <u>D</u><sup>≤n</sup> is the full subcategory of <u>D(A)</u> of complexes with zero cohomology above n, τ<sub>≤n</sub> provides a right adjoint of the inclusion <u>D</u><sup>≤n</sup> ⊂ <u>D(A)</u>.

- The special subcategory <u>A</u> of <u>D(A)</u> can be constructed as follows.
- Define functors \(\tau\)≤n and \(\tau\)≥n, \(\D(A)\) → \(\D(A)\) by truncating complexes at position n:

$$\cdots \to A^{n-2} \to A^{n-1} \to \ker d^n \to 0 \to \cdots$$
$$\cdots \to 0 \to \operatorname{coker} d^n \to A^{n+1} \to A^{n+2} \to \cdots$$

These have the property that for all objects *a* of  $\underline{D}(\underline{A})$ , there is a canonical distinguished triangle  $\tau_{\leq n}a \rightarrow a \rightarrow \tau_{\geq n+1}a$ .

- Then if <u>D</u><sup>≤n</sup> is the full subcategory of <u>D(A)</u> of complexes with zero cohomology above n, τ<sub>≤n</sub> provides a right adjoint of the inclusion <u>D</u><sup>≤n</sup> ⊂ <u>D(A)</u>.
- and  $\underline{D}^{\geq n+1}$  is the left orthogonal of  $\underline{D}^{\leq n}$

- The special subcategory <u>A</u> of <u>D(A)</u> can be constructed as follows.
- Define functors \(\tau\)≤n and \(\tau\)≥n, \(\D(A)\) → \(\D(A)\) by truncating complexes at position n:

$$\cdots \to A^{n-2} \to A^{n-1} \to \ker d^n \to 0 \to \cdots$$
$$\cdots \to 0 \to \operatorname{coker} d^n \to A^{n+1} \to A^{n+2} \to \cdots$$

These have the property that for all objects *a* of  $\underline{D}(\underline{A})$ , there is a canonical distinguished triangle  $\tau_{\leq n}a \rightarrow a \rightarrow \tau_{\geq n+1}a$ .

- Then if <u>D</u><sup>≤n</sup> is the full subcategory of <u>D(A)</u> of complexes with zero cohomology above n, τ<sub>≤n</sub> provides a right adjoint of the inclusion <u>D</u><sup>≤n</sup> ⊂ <u>D(A)</u>.
- and  $\underline{D}^{\geq n+1}$  is the left orthogonal of  $\underline{D}^{\leq n}$
- Then  $\underline{A} = \underline{D}^{\leq 0} \cap \underline{D}^{\geq 0}$ .

#### More generally:

• Given an exact subcategory  $\underline{D} \subset \underline{T}$  such that  $\underline{D}[1] \subset \underline{D}$  and for each object a of  $\underline{T}$  there is a distinguished triangle  $a' \to a \to a''$  with a' in  $\underline{D}$  and a'' in  $\underline{D}^{\perp}$ . We call this a *t*-structure on  $\underline{T}$ .

#### More generally:

- Given an exact subcategory  $\underline{D} \subset \underline{T}$  such that  $\underline{D}[1] \subset \underline{D}$  and for each object a of  $\underline{T}$  there is a distinguished triangle  $a' \to a \to a''$  with a' in  $\underline{D}$  and a'' in  $\underline{D}^{\perp}$ . We call this a *t*-structure on  $\underline{T}$ .
- Define  $\underline{C} = \underline{D} \cap \underline{D}^{\perp}[1]$ , the core or heart of the *t*-structure. Then  $\underline{C}$  is abelian.

- Given an exact subcategory <u>D</u> ⊂ <u>T</u> such that <u>D[1]</u> ⊂ <u>D</u> and for each object a of <u>T</u> there is a distinguished triangle a' → a → a'' with a' in <u>D</u> and a'' in <u>D</u><sup>⊥</sup>. We call this a *t*-structure on <u>T</u>.
- Define  $\underline{C} = \underline{D} \cap \underline{D}^{\perp}[1]$ , the core or heart of the *t*-structure. Then  $\underline{C}$  is abelian.
- The maps  $a \to a'$  and  $a \to a''$  give well defined functors  $\tau_{\leq 0} : \underline{T} \to \underline{D}$  and  $\tau_{\geq 0} : \underline{T} \to \underline{D}^{\perp}[1]$  which are left (resp. right) adjoint to the inclusions.

- Given an exact subcategory <u>D</u> ⊂ <u>T</u> such that <u>D[1]</u> ⊂ <u>D</u> and for each object a of <u>T</u> there is a distinguished triangle a' → a → a'' with a' in <u>D</u> and a'' in <u>D</u><sup>⊥</sup>. We call this a *t*-structure on <u>T</u>.
- Define  $\underline{C} = \underline{D} \cap \underline{D}^{\perp}[1]$ , the core or heart of the *t*-structure. Then  $\underline{C}$  is abelian.
- The maps  $a \to a'$  and  $a \to a''$  give well defined functors  $\tau_{\leq 0} : \underline{T} \to \underline{D}$  and  $\tau_{\geq 0} : \underline{T} \to \underline{D}^{\perp}[1]$  which are left (resp. right) adjoint to the inclusions.
- Then  $H_D^0 : \underline{T} \to \underline{C}$  defined by  $a \mapsto \tau_{\geq 0} \tau_{\leq 0} a$  is cohomological.

- Given an exact subcategory <u>D</u> ⊂ <u>T</u> such that <u>D[1]</u> ⊂ <u>D</u> and for each object a of <u>T</u> there is a distinguished triangle a' → a → a'' with a' in <u>D</u> and a'' in <u>D</u><sup>⊥</sup>. We call this a *t*-structure on <u>T</u>.
- Define  $\underline{C} = \underline{D} \cap \underline{D}^{\perp}[1]$ , the core or heart of the *t*-structure. Then  $\underline{C}$  is abelian.
- The maps  $a \to a'$  and  $a \to a''$  give well defined functors  $\tau_{\leq 0} : \underline{T} \to \underline{D}$  and  $\tau_{\geq 0} : \underline{T} \to \underline{D}^{\perp}[1]$  which are left (resp. right) adjoint to the inclusions.
- Then  $H_D^0 : \underline{T} \to \underline{C}$  defined by  $a \mapsto \tau_{\geq 0} \tau_{\leq 0} a$  is cohomological.
- <u>C</u> gives us an abelian "viewport" into <u>T</u>.

- Given an exact subcategory <u>D</u> ⊂ <u>T</u> such that <u>D[1]</u> ⊂ <u>D</u> and for each object a of <u>T</u> there is a distinguished triangle a' → a → a'' with a' in <u>D</u> and a'' in <u>D</u><sup>⊥</sup>. We call this a *t*-structure on <u>T</u>.
- Define  $\underline{C} = \underline{D} \cap \underline{D}^{\perp}[1]$ , the core or heart of the *t*-structure. Then  $\underline{C}$  is abelian.
- The maps  $a \to a'$  and  $a \to a''$  give well defined functors  $\tau_{\leq 0} : \underline{T} \to \underline{D}$  and  $\tau_{\geq 0} : \underline{T} \to \underline{D}^{\perp}[1]$  which are left (resp. right) adjoint to the inclusions.
- Then  $H_D^0 : \underline{T} \to \underline{C}$  defined by  $a \mapsto \tau_{\geq 0} \tau_{\leq 0} a$  is cohomological.
- <u>C</u> gives us an abelian "viewport" into <u>T</u>.
- For example,  $\times 2 : \mathbb{Z} \to \mathbb{Z}$  injects in <u>Ab</u> but there is a core in <u>D(Ab)</u> for which is does not inject but surjects with kernel  $\mathbb{Z}_2[-1]$ .
